Application of microdoses of boron accelerates develop-
ment and ripening of cotton, reduces the percentage of
fruit organs dropping off, increases the yield of raw
cotton as well as the percentage of seed in the boll and
the oil content of the seed. In view of the low mobility
of boron compounds through the cotton shrub, the best
means of applying microdoses of boron is by applying it
fractionally: part prior to sowing into the soil and part

The kinetics of ethyl acetate hydrolysis in the presence
of cationic KU-1, and also in the presence of different
samples of this cationites with a partial replacement in
those of the hydrogen-ion through the ion ammonium-
triethylbenzyl was studied. Only the strongly acid
functional group (sulfonic group) shows a catalytic
ability. In neutral or little acid medium, in the bifunc-
tional cationites. The introduced complex ion of ammo-
nium-triethylbenzyl diminishes the catalytic ability of
the remaining, nonsubstituted hydrogen ions. (Author)
